并行计算第4次作业

10.6

算法的(1)部分的时间复杂度为 $O(\frac{n}{p})$

算法的(2)部分时间复杂度:

2.2: $O(\frac{n}{p})$

2.4: $O(\log p)$

2.5: O(n)

2.7: $O(\frac{n^2}{p})$

循环执行O(n)次

总计: $O(nlog p + \frac{n^3}{p})$

算法的(3)部分时间复杂度为: $O(\frac{n}{p})$

综上,整个算法的时间复杂度为 $O(nlog p + \frac{n^3}{p})$

11.5

算法如下

主要修改是第7行和第16行

```
input: \vec{b} = (b_0, b_1, ..., b_{n-1})
   output: \vec{a} = (a_0, a_1, ..., b_{n-1})
 1 (1)for k = 0 to n-1 do
 c_k = a_k
 3 end
 4 (2) for h = log n - 1 to \theta do
        (2.1) p = 2^h;
        (2.2) q = \frac{n}{p};
 6
        (2.3) z = w^{\frac{-q}{2}};
 7
        (2.4) for k = 0 to n-1 do
 8
            if k \mod p = k \mod 2p then
 9
                 (i)c_k = c_k + c_{k+p};
10
                 (ii)c_{k+p} = (c_k - c_{k+p})z^{k \mod p}
11
            \mathbf{end}
12
        \mathbf{end}
13
14 end
15 (3) for k = 1 to n-1 do
    br_{(k)} = \frac{1}{n}c_k;
17 end
```

流图如下:
